ACTIVE-Compliance
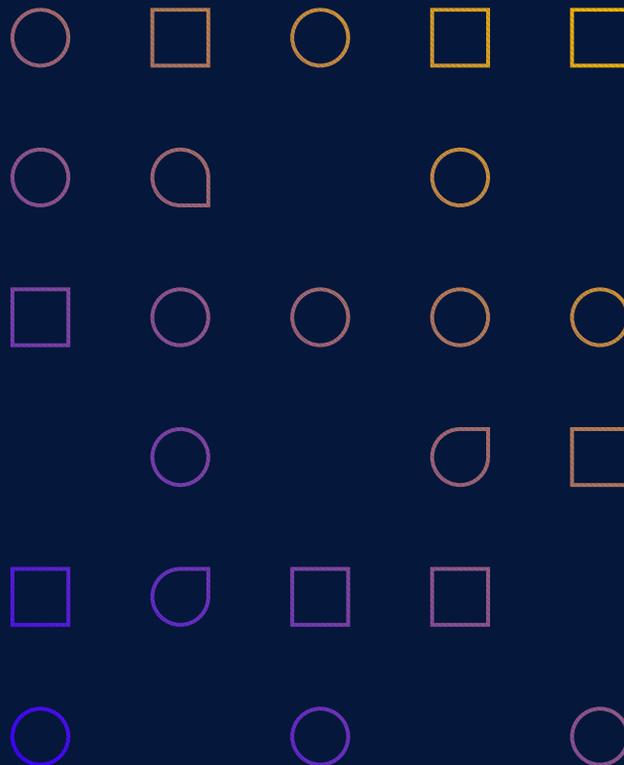

Lower the risk profile of your unstructured data by understanding what data you have and where it's stored. Map, classify and manage data at scale.
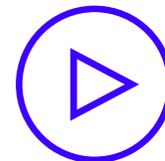

Shine a Light on "Dark Data"

During the course of normal business activity, organizations are generating and collecting massive amounts of data. Many are struggling to control data growth, leading to vast stores of unknown "dark data" and increased risk.

ACTIVE-Compliance offers content cleanup together with identification and remediation of sensitive data. Whether used as part of a data privacy, storage optimization or risk mitigation program, ACTIVE-Compliance works at scale and provides information down to the file level, enabling rapid and informed remediation decisions.

Deployed to a virtual, physical or cloud hybrid environment, ACTIVE-Compliance provides a map of e-trash, redundant, obsolete and trivial (ROT) content and potentially sensitive data. Working on content in place, it allows unwanted files to be removed or quarantined efficiently in bulk and presents workflow-driven review of sensitive data violations for remediation.

- Analyze large data volumes (petabyte scale)
- Robust list of connectors including SharePoint, Exchange, Office 365 Confluence, OpenText and G Suite

ACTIVENAV

On-prem software

Quick time-to-value

4.5/5* on Gartner Peer Insights

As a leader in the file analysis market, ActiveNav is well positioned to help organizations of all sizes establish a program that can achieve regulatory compliance and minimize information risk.

Resolve data spillage and PII

Discover and remediate sensitive content including social security numbers, credit card numbers, date of birth and other sensitive content using automated rules.

Optimize data storage infrastructure

Enjoy typical storage reductions of 30%+ by defensibly deleting e-trash, ROT (Redundant, Obsolete, and Trivial), stale and low value content.

Powerful reporting and visualizations

Fully configurable reporting modules allow insights into the discovered data and any downstream actions taken.

Out-of-the-box and customizable rules

Pre-built workflows, rule sets and taxonomies that help customers do common tasks such as finding ROT data, as well as identifying sensitive information. Custom workflows can be built to achieve bespoke results.

Sensitive data remediation

The flexible deployment model and user interface removes the need for specialist expertise to effectively deal with large data volumes.

Defensible data minimization

With built-in audit functions, all actions form part of a defensible and repeatable process. Automated workflows prevent runaway growth.
