# ACTIVE-Governance

Proactively monitor the quality and compliance of your content. Enforce retention policies and address legal and regulatory requirements with automated, defensible workflows.

Analyze. Classify. Notify.

Effective information governance is critical, helping your business to achieve and maintain compliance with evolving privacy, legal and regulatory requirements.

ACTIVE-Governance finds and remediates sensitive data, e-trash, leaked records and other content issues and continually monitors for any discrepancies. When found, workflows are started and disposal action is initiated in place. Importantly, because these activities are policy-driven and fully audited, the whole process is defensible.

ACTIVE-Governance monitors connected repositories, applys policies and notifies information owners and relevant users for action as part of a repeatable process.

ACTIVE-Governance also prepares content for migration. Cleaning data before migration results in lower volume-based migration costs and higher quality migrated data.

- Stay on top of content risk and growth by managing sensitive data
- Grow governance maturity with contined feedback about content risk
- On-going records and governance policies can significantly reduce the cost of legal holds, early case assessment and collection

4.5/5* on Gartner Peer Insights

ACTIVENAV

Proactive, not reactive.

With consistent policies in place, content monitoring becomes deliberate, managed and defensible rather than ad-hoc.

Monitor and manage content in place

Achieve visibility into what data your organization is currently storing and managing. Resolve record leakage, disposition and retention.

Create a rich set of metadata

Classify and tag data to create metadata and drive records management, enable business processes and enhance navigation.

Straightforward policy enforcement

Deploy policies on content at rest or in use for quality, health, value and compliance. Augment metadata against business schema and policies.

Resolve record leakage, disposition and retention

Remediate sensitive data and reduce data risk in the event of a breach. Identify records/sensitive data for regulatory compliance and proactive e-Discovery savings.

Rationalize file share structure

Re-structure files based upon classification and analysis results. Map content to file plans, taxonomies and other metadata types.

Prepare content for migration

Screen for and remediate sensitive data before migration exposes it to search or leaks it to a cloud destination. Reduce storage costs by moving only the content you actually need.
