

ACTIVE- Inventory

Understand the health, risk and value of your data with an always-on, single pane-of-glass view into your data repositories, on-prem and in the cloud.

Data Mapping as a Service (DMaaS)

Identifying data that meets specific health factors, such as stale and large, helps organizations find and address areas of risk within their data universe.

ACTIVE-Inventory empowers enterprises, federal agencies and public sector entities to use their information effectively and deliver business value by bringing together data from a diverse range of sources with an always-on inventory and actionable insights.

ACTIVE-Inventory discovers, maps, and aggregates data on-prem or in the cloud and provides compelling and highly usable visualizations of the health of that data. This allows data owners and information professionals to readily make defensible decisions for its disposal, protection or re-use as a valuable business asset.

- Build a cross-repository inventory of all your content
- Continuously monitor inventory
- Visualize and explore content at scale

Data health is based on easily understandable elements discovered during the mapping process such as data age, size, content type and duplication.

**On-prem and
in the cloud**

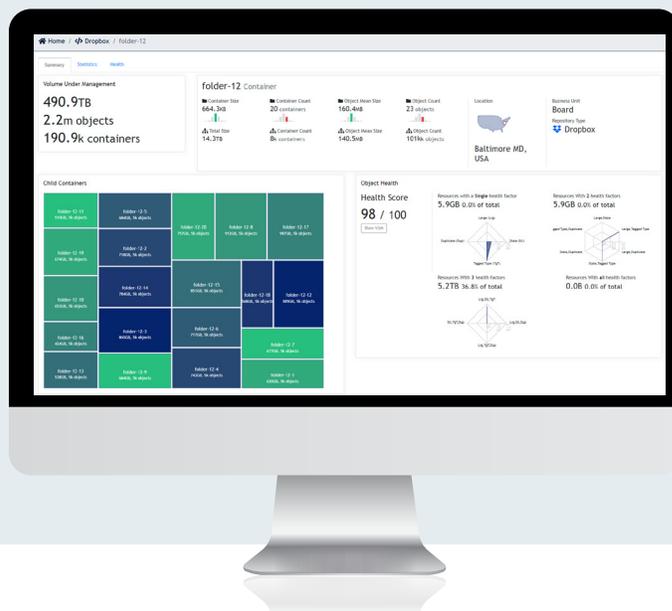

**Actionable
insights**

**Benchmark
against peers**

Whether used as part of a data mapping, minimization, migration or storage optimization project, ACTIVE-Inventory provides the insights needed to support all your data initiatives.

Build data maps in minutes not days or weeks

ACTIVE-Inventory is an easy to deploy solution that scales on demand and provides near-real time data health scoring and insight

Low deployment footprint and network impact

The unique hybrid collector architecture deploys quickly with a low footprint as all the heavy lifting is done in the cloud

Isolate and visually depict areas of risk

Diverse data sources are presented in a single view with so that data health can be dealt with in one place

Powerful data health scoring

Data health is scored and mapped in context by business unit, geography, repository or host enabling rapid decision making with actionable recommendations

Visualize and action content at scale

The flexible deployment model and user interface removes the need for specialist expertise to effectively deal with large data volumes

Reduce costs associated with dark data

Work with content across key facets, such as geographic location, ownership, and repository type to understand and manage dark data
