

Empowered Insights

Stop drowning in data and start visualizing it with ActiveNav's data privacy and governance software.

Actionable Data Intelligence

Power and utility companies are creating and storing vast amounts of data to ensure continuous service for their customers. While this data often has value, it's frequently laced with some measure of toxicity. Since this sector handles many different types of sensitive, confidential, and proprietary business information, it creates an irresistible target for hackers.

How can power and utility companies take advantage of all this data that is being generated to create value while still complying with regulations and protecting against cyber threats? To remain competitive, companies can no longer just amass data, without a clear plan for identifying, securing, accessing, and managing their (and their customer's) data.

At ActiveNav, we help our customers drive innovation and productivity by shining a light on their vast amounts of "dark data" – providing valuable insights and ensuring that data is protected and governed throughout its lifecycle. Our industry-leading software can bring order to your data and help you meet your business, legal, and regulatory obligations. We work with numerous power and utility organizations and their partners to address the industry's unique challenges.

You're in good company...

Don't just take our word for it

“ActiveNav has been instrumental in helping us manage our data mapping, classification, and content clean-up, saving Plains Midstream Canada valuable time and money.”

- Erin Delorme, Information Systems, Plains Midstream Canada

Data discovery and mapping

Build a map of all your dark data, at scale, to better understand what data you actually have, what levels of redundant, obsolete, and trivial (ROT) data exist and prioritize business areas for a deeper analysis.

Efficient records management and M365

Identify, and manage in-place, official records. Prepare, tag and label content as part of a wider M365 program. Our solution can identify, and label, documents in conjunction with Microsoft Information Protection (MIP).

Divestitures, mergers, and acquisitions

Identify sensitive information to ensure you're not incorrectly transferring information that's not required, or receiving information that could cause a liability. Identify data locations that form part of a divestiture.

Comply with evolving privacy laws

Comply with country or industry-specific regulations using out-of-the-box or customized classification rules. Monitor and act on content in place.

Identify critical assets and "crown jewels"

Find and secure "at risk" data by building a data map of your unstructured content repositories and to drill into the content to identify critical IP/data assets. Provide evidence of compliance with fully auditable defensible workflows.

Reduce costs with ongoing data governance

Optimize your data management and data storage infrastructure. Defensibly delete data that no longer provides business value and reduce the cost of early case assessments.
